Choosing the Right Plants

The first step in starting a garden is choosing the right plants. Consider the climate in your area, the amount of sunlight your garden receives, and the type of soil you have. You should also think about what you want to grow, whether it's vegetables, fruits, flowers, or a combination of all three.

Once you have a general idea of what you want to grow, it's time to start selecting specific plants. Diane Capri recommends visiting local nurseries to get advice from experts and see what plants are best suited to your climate and growing conditions.

Soil Preparation

The soil is the foundation of your garden, so it's important to prepare it properly before planting. The first step is to test your soil to determine its pH level and nutrient content. This will help you determine what amendments you need to add to the soil to make it ideal for growing plants.

Diane Capri recommends adding organic matter to the soil, such as compost or manure. This will help to improve drainage, aeration, and water retention. You may also need to add fertilizer to the soil, depending on the results of your soil test.

Planting Techniques

Once you have prepared the soil, it's time to start planting. Diane Capri provides detailed instructions on how to plant different types of plants, including vegetables, fruits, flowers, and trees. She also covers important topics such as spacing, depth, and watering.

It's important to follow the planting instructions carefully to ensure that your plants get the best start possible. Diane Capri's expert advice will help you avoid common mistakes and maximize your chances of success.
